DYNAMIC PRE-SIEVES PCD SERIES

*The **Dynamic Pre-sieves ,PCD Series**, are designed to realize the first court of the material in the primary phase. His function is the material separates mas thin that is not suitable (sterile), or that does not need primary crushing.*

They are very robust machines, designed to support the impacts of the primary material. The top tray is made like grating, in one or several heights, which it favors I turn and the best sifted one of the materials. Optionally it is possible to place a low sieve of conventional mesh, realize a sifted second.

We make the pre-sieves, in diverse broad and long, always adapting the design to the machine that feeds to the sieve and to the machines to which the material treated by the precribador is going to go.
